

TSR - Traffic Sign Recognition

[Watch a live demonstration of the system here](#)

This project is a Traffic sign recognition and text-to-speech system based on machine learning.

Traffic Sign Recognition

- Utilizes the [YOLO \(YOLOv11\)](#) model for real-time traffic sign detection.
- The model is trained on a dataset specified in the `config.yaml` file and saved in ONNX and PyTorch formats.
- Sign detection with tts is implemented in the `tsr.py` script, which uses a camera to capture images and detect traffic signs and uses the ParlerTTS model to generate voice messages based on the detected signs.
- You can see a live preview in `rt_tsr.py`.

Text-to-Speech

- Uses the ParlerTTS model to generate speech based on detected traffic signs.
- The implementation is found in the `TSR_TTS` class in the `tsr_tts.py` file.

Model Training

- The process of training the YOLO model is visible in the Jupyter notebook `training.ipynb`.
- Training parameters are configured in the `config.yaml` file.

Project Structure

- The `models` folder contains saved models in ONNX and PyTorch formats.
- The `data` folder contains training, testing, and validation data.
- The `audio` folder stores generated audio files and temporary sound files.
- Archives:
 - `old_models` folder contains old models.
 - `old_data` contains old datasets (not uploaded to GitHub).

How It Works

1. **Traffic Sign Detection:** The system captures images from a camera and uses the YOLO model to detect traffic signs in real-time. The detected signs are then classified and labeled.
2. **Text-to-Speech Generation:** Based on the detected signs, the system generates corresponding voice messages using the ParlerTTS model. These messages are then played back to the user.

Usage

1. **Setup:** Ensure you have all the required dependencies installed. Make sure you have the correct versions of Torch and CUDA installed. You can install them from [PyTorch's official site](#).
2. **Running the Traffic Sign Recognition with tts:**

```
python tsr.py
```

3. **Running real time preview:**

```
python rt_tsr.py
```

Final Model

- The final model is saved in the `models` folder as 'tsrm.onnx' and 'tsrm.pth'.
- It was trained using the YOLOv11 medium model.
- Final model was trained on a dataset of 1060 images of traffic signs/
- The model was trained for 350 epochs.
- The model can recognize 24 classes of Polish traffic signs:
 - **A-1:** Niebezpieczny zakręt w prawo
 - **A-11a:** Próg zwalniający
 - **A-16:** Przejście dla pieszych
 - **A-17:** Uwaga dzieci
 - **A-2:** Niebezpieczny zakręt w lewo
 - **A-30:** Inne niebezpieczeństwo

- o A-7: Ustap pierwszeństwa
- o B-1: Zakaz ruchu w obu kierunkach
- o B-2: Zakaz wjazdu
- o B-20: STOP
- o B-21: Zakaz skręcania w lewo
- o B-22: Zakaz skręcania w prawo
- o B-23: Zakaz zawracania
- o B-33: Ograniczenie prędkości
- o B-36: Zakaz zatrzymywania się
- o B-41: Zakaz ruchu pieszych
- o C-12: Rondo
- o C-2: Nakaz jazdy w prawo za znakiem
- o C-5: Nakaz jazdy prosto
- o D-1: Droga z pierwszeństwem
- o D-18: Parking
- o D-3: Droga jednokierunkowa
- o D-6: Przejście dla pieszych
- o D-6b: Przejście dla pieszych i droga dla rowerzystów

- You can see the process of training the model in the `training.ipynb` notebook.

Model Performance

The model's performance was evaluated on a validation dataset. Below are examples of the ground truth labels and the model's predictions:
